

A cutting edge genetic range: herbicide-resistant varieties.

For many years now, RAGT has been developing hybrids that resist herbicides by natural selection.

These innovations provide a very practical response to the demand for weed control solutions from users coping with adventitious plants that are increasingly difficult to contain.

2 ranges of hybrids available in Europe:

- DUO System ® maize varieties

RAGT is the only European seed producer to market such a rich and varied range in terms of early maize varieties that are naturally resistant to Stratos® Ultra / Focus® (BASF® brand). Use of this powerful graminicide herbicide allows effective control of the majority of annual and perennial grasses, with the added advantage of greater flexibility of use.

Over 15 DUO RAGT grain maize and fodder maize varieties are available.

If you would like more information on our DUO System range, please get in touch with your RAGT contact on our website by selecting your country in the contact tab.

- Clearfield® sunflower and rape oil seeds

Clearfield® technology opens up the prospects for control of the usual difficult post-emergence control of adventitious weeds in sunflower and rapeseed thanks to the combination of a BASF herbicide solution and varieties that are tolerant to this herbicide.

Simple, more effective and more reliable, this innovation offers a response to highly demanding growing conditions.

If you would like more information on our CL range, please get in touch with your RAGT contact on our website by selecting your country from the contact tab.
